

## The Library SysInitLibrary.lib

---

This library contains a function which can be used to initialize an external library, which is available as an obj-file in COFF format. Thus modifications in the library can be given to the PLC by a download and no modification in the runtime system is required. But: In order to get this done properly, all function calls must be resolved within the obj-file and the target system must support the functionality. The execution is synchronous.

### SysInitLibrary

This function of type BOOL can be used to initialize an external library, for which an obj-file is available in COFF format.

TRUE is returned after the operation has been finished successfully, otherwise FALSE.

<b>Input Variable</b>	<b>Data type</b>	<b>Description</b>
index	DINT	Index of the external library reference. Can be retrieved by using the function <libname>SetPointer. See the documentation on the runtime system for more details.
